Semantic Web Technologies

SKOS

Jos de Bruijn
debruijn@inf.unibz.it

KRDB Research Group
Free University of Bolzano, Italy

Based on slides by Mark van Assem, Antoine Isaac, Alistair Miles

Intro

- SKOS
  - "Simple Knowledge Organisation System(s)"
  - Simple, extensible, machine-understandable representation for "concept schemes"
    - Thesauri
    - Classification Schemes
    - Taxonomies
    - Subject Headings
    - Other types of 'controlled vocabulary'...

SKOS Development

- Developed by W3C's Semantic Web Best Practices-WG
- Draft for Working Group Note
- Design: public, consensus-driven, open community, email
- Input from actual vocabulary maintainers

Motivation

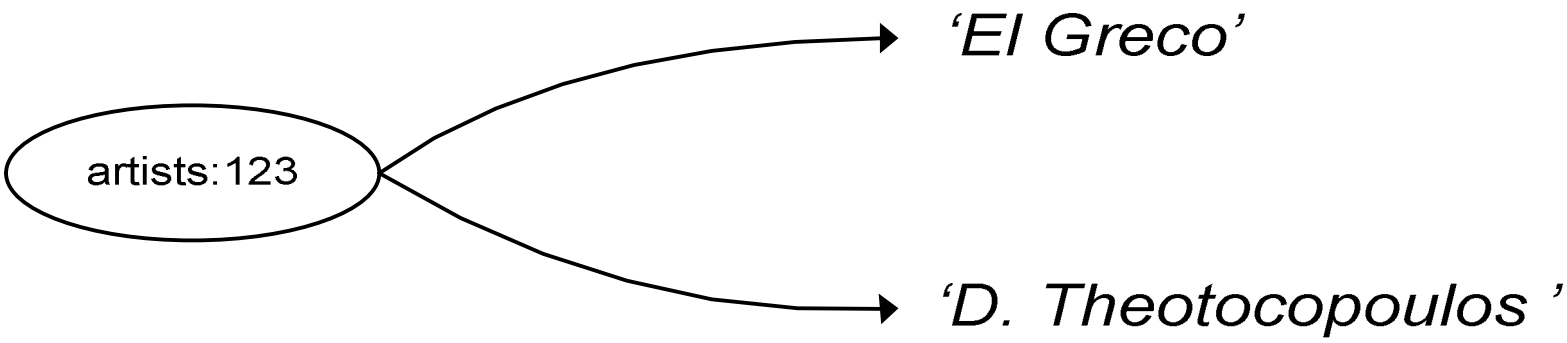
Semantic Web technology can help improve search facilities and reuse:

1. Concept-based search instead of text-based search
2. Reuse each other's concept definitions
3. Search across (institution) boundaries
4. Standard software

1. Concept Search

- Painter Domenikos Theotocopoulos = "El Greco" (nickname)
- Some indexers use "El Greco", others "D. Theotocopoulos"
- Searching for "El Greco" does not give all results
- Solution: one *concept* with different *lexical labels*.

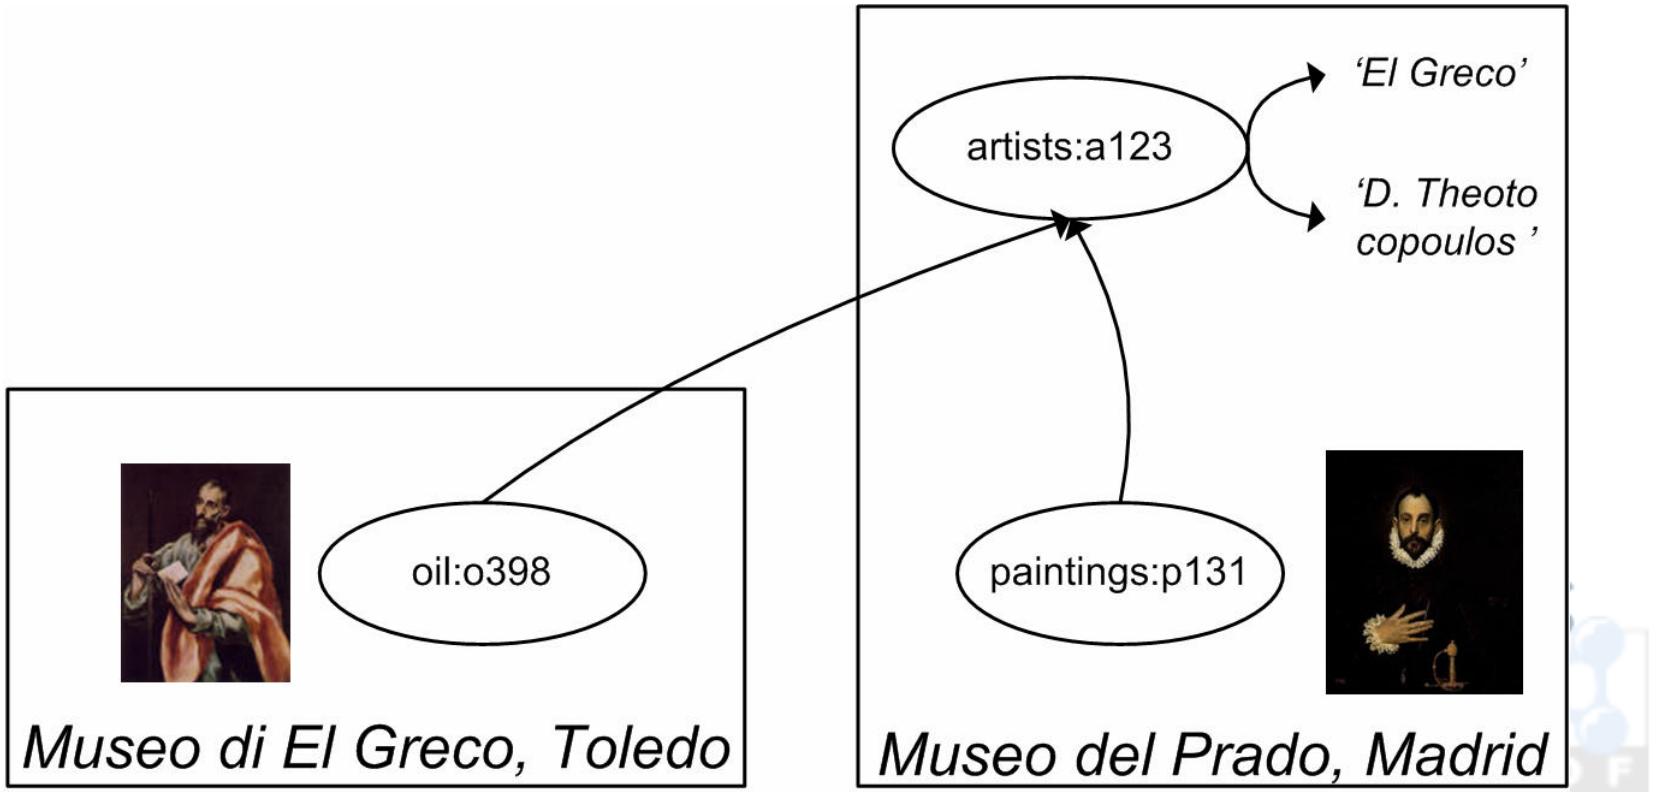
Example



- N.B.: vocabulary with *identifiers* for preferred terms and indexing with *identifiers* accomplishes this

2. Reuse

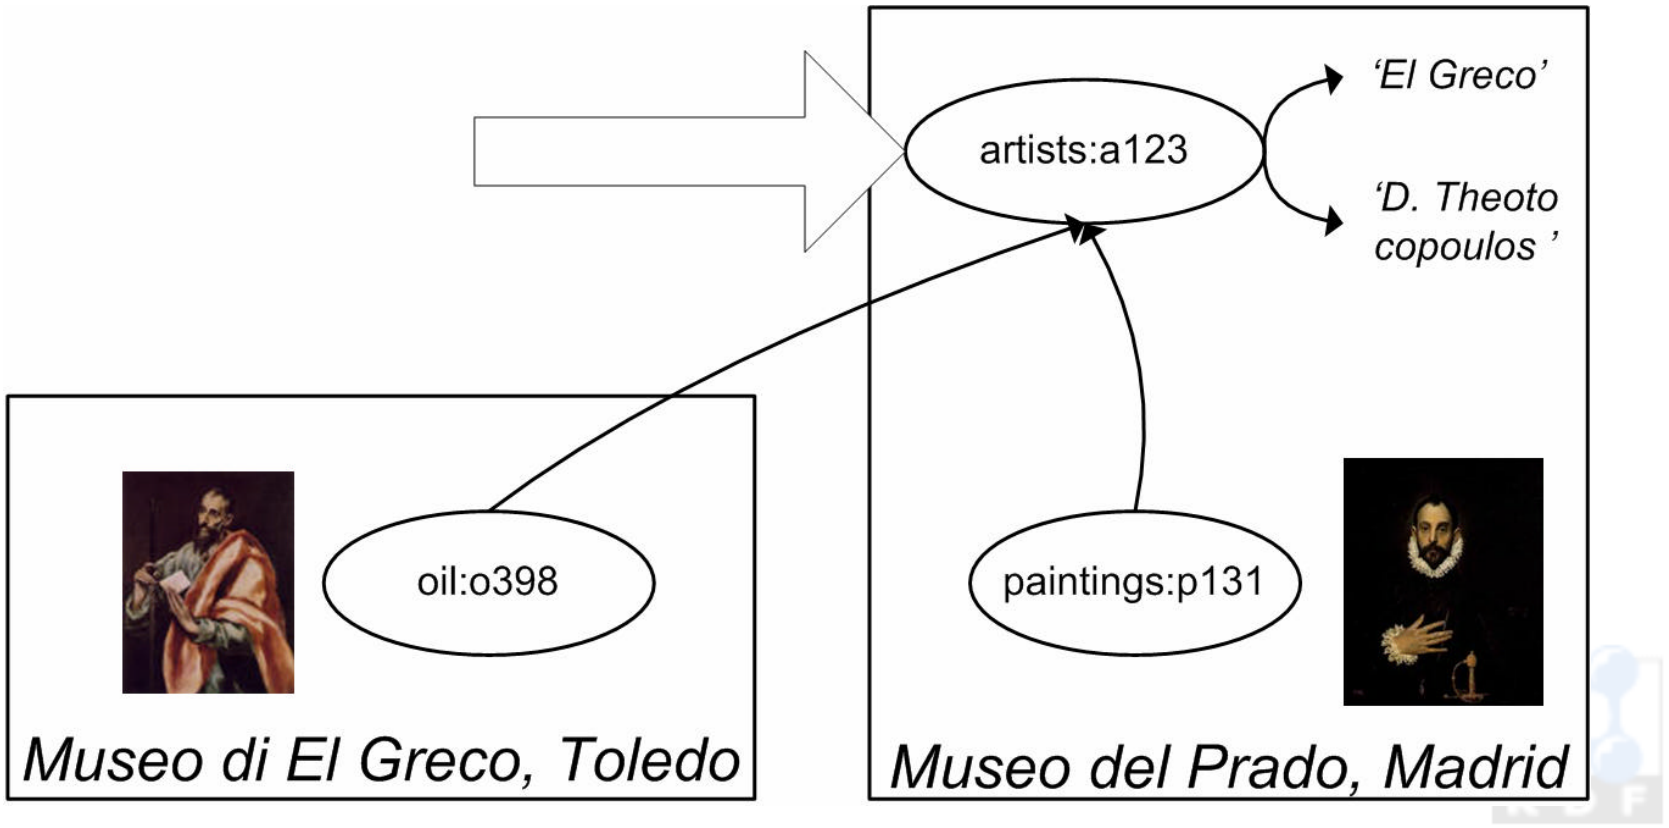
- Reuse existing concept “El Greco”
  - ✍ Req. 1: one “exchange syntax”
  - ✍ Req. 2: “point” at other concepts



3. Search Across Boundaries

- Search for *concept* "El Greco" returns paintings from both institutions

✍ Same requirements



4. Standard Software

- If all concept schemes use same "exchange syntax" and "structure", standardized software can be built to:
  - Display/browse concept scheme
  - Annotate with concept scheme
  - Integrate data from 2 institutions using standard concept schemes ("search across boundaries")

✍ Req. 3: Similar *structures* (graphs) in exchange syntax

Why SKOS helps

SKOS uses RDF

- sharing "graphs" in distributed environment (intranet/internet)
- Uses URIs for "pointing" (identifying)
- Easy to extend by anyone for specific purposes

✍ "exchange syntax"

✍ "Point at concept"

SKOS: set of *classes* and *properties* to describe concept schemes

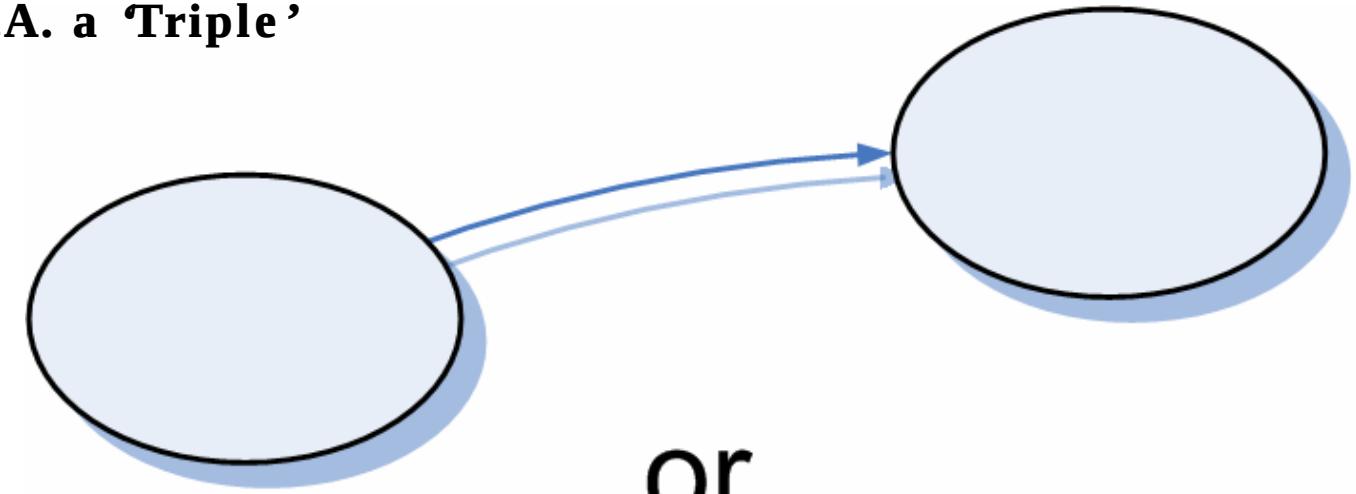
- Produce "similar graphs"

✍ "Same structures"/ clear what graph means

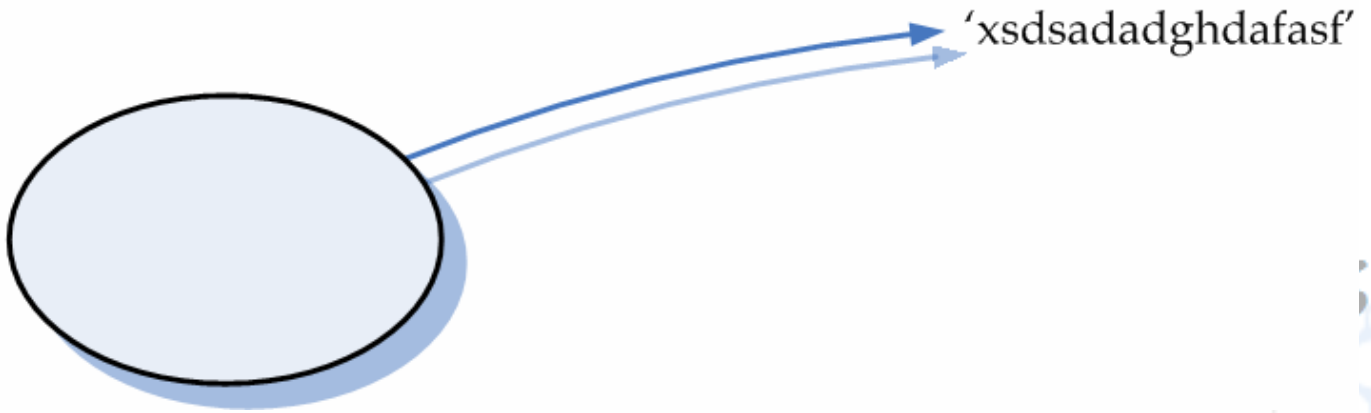
Disadvantage: unusual concept schemes don't fit into SKOS (original structure too complex)

Quick RDF: a ‘Statement’

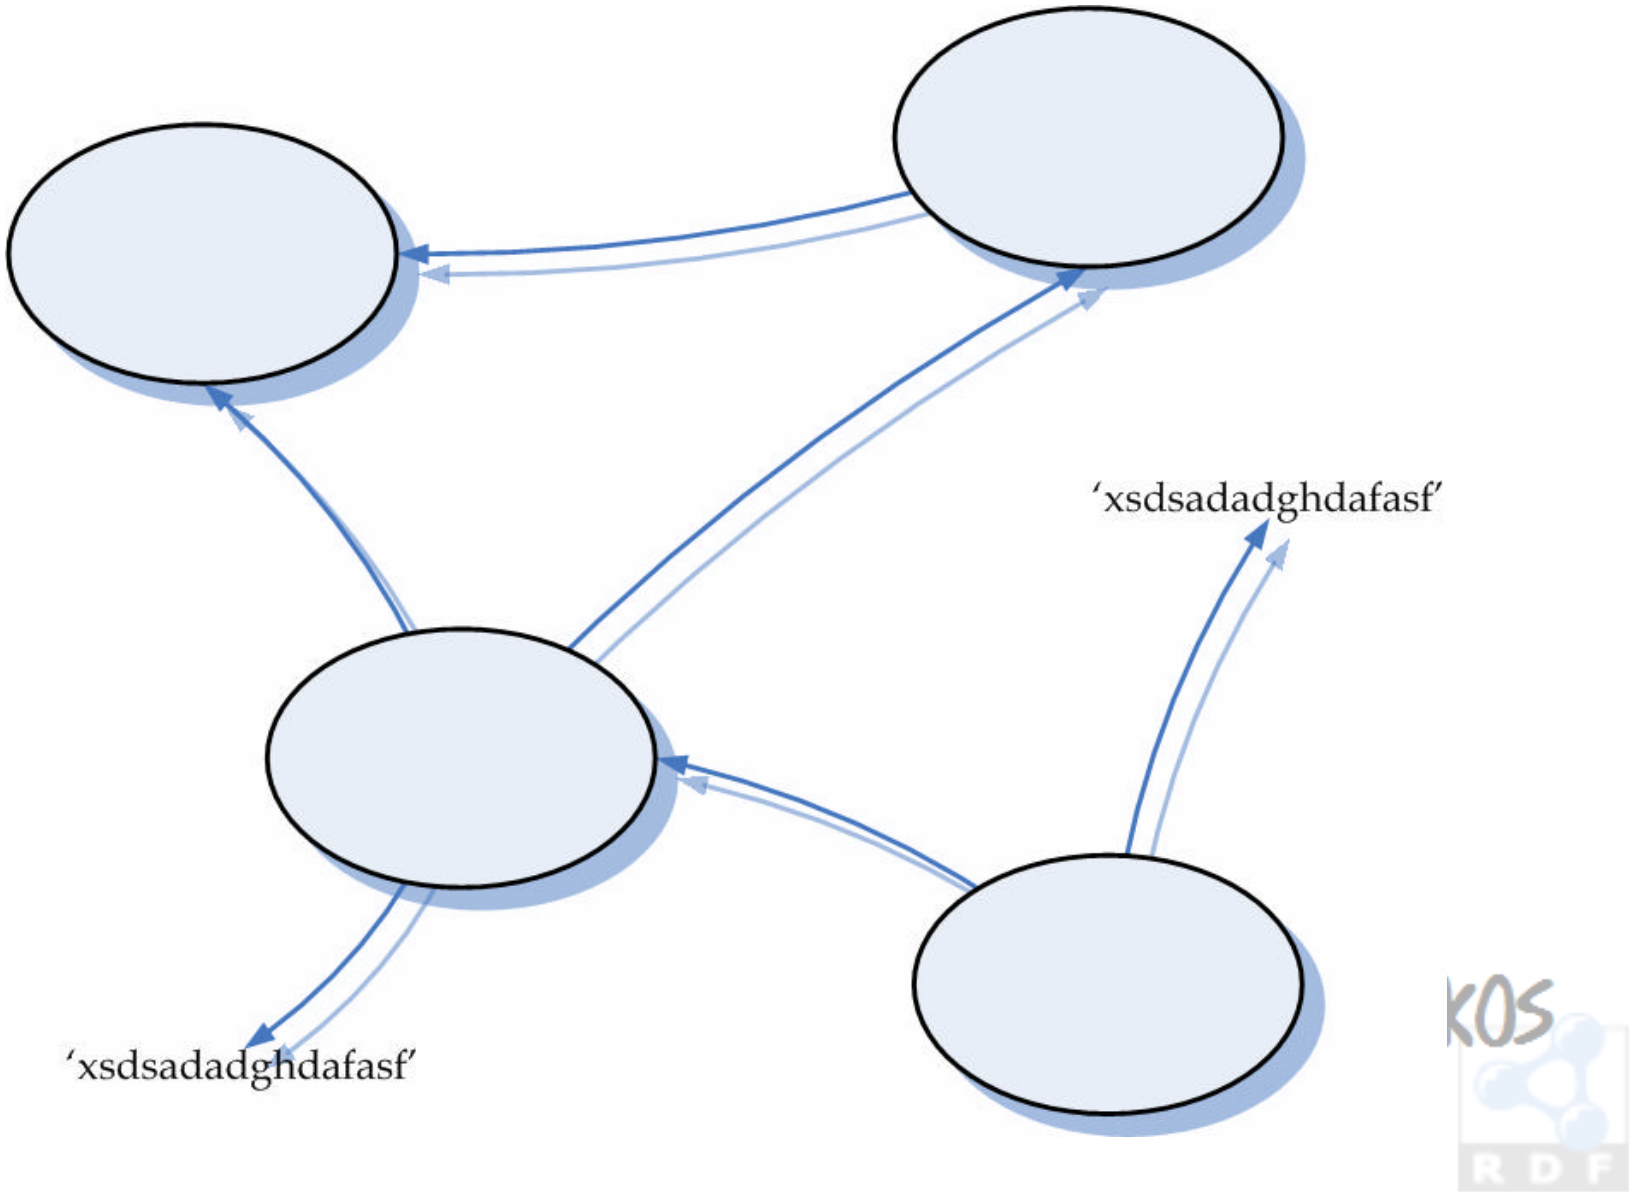
A.K.A. a ‘Triple’



or...



Quick RDF: a 'Graph'



Quick RDF: exchange syntax

- RDF Graphs can be exchanged in XML (and other formats)
- Alternative ways to represent & exchange the *same* graph
- Here we only discuss RDF graphs, exchange syntax is "lower-level" technical issue

Controlled Vocabulary

Love

> Strong feelings of attraction towards, and affection for, another adult, or great affection for a friend or family member.

Awe

> A feeling of great respect sometimes mixed with fear or surprise.

Joy

> A feeling of bliss and great happiness.

Converting into SKOS graph

1. Identify
2. Describe
3. Publish

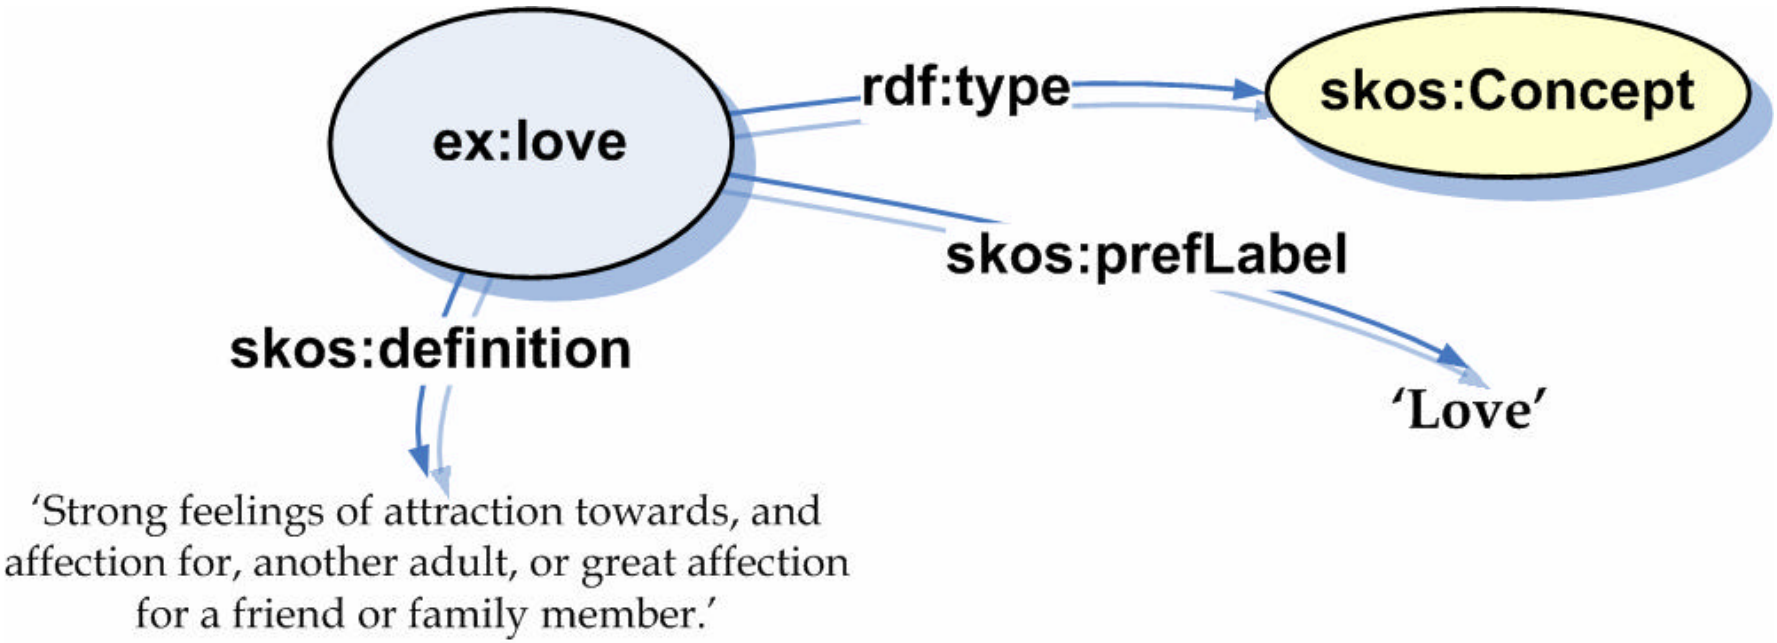
Identify

- Step 1: Identify concepts…

  http://www.example.com/concepts#love
  http://www.example.com/concepts#awe
  http://www.example.com/concepts#joy

Describe

- Step 2: Describe…



Publish

- Step 3: Publish…
  - Put the file on a web server for programs to download & process
  - Put the file on special RDF server on which you can query with SQL-like language:
    - Select * from … Where …

Thesaurus (USE/UF)

Love (*preferred term*)

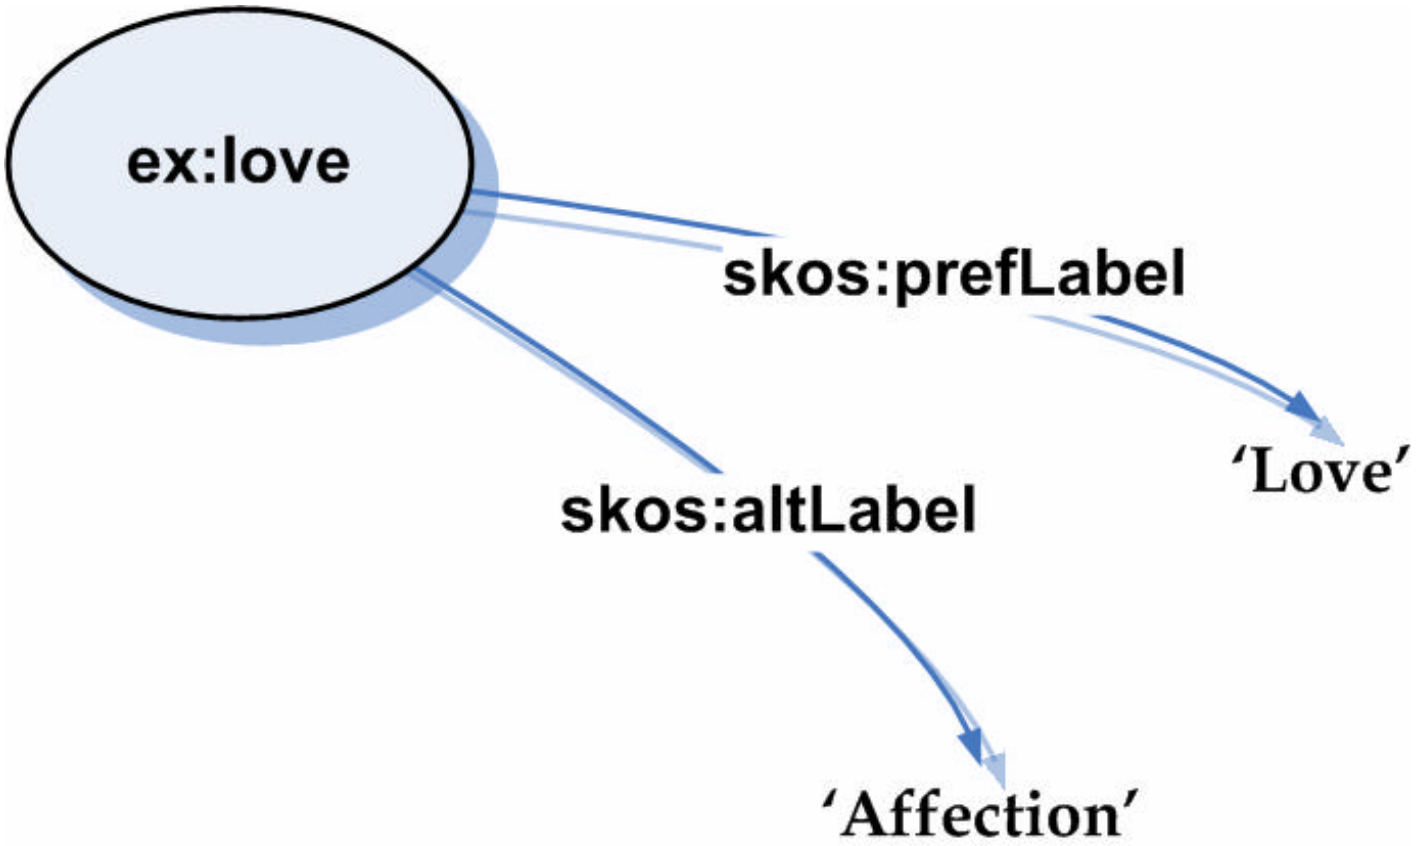
UF Affection

Affection (*non-preferred term*)

USE Love

("USE" directs user from non-pref term to pref-term that should be used in indexing and search)

Lexical Labels



Thesaurus (BT/NT)

Love

BT Emotion (*"BT" = Broader Term*)

Emotion

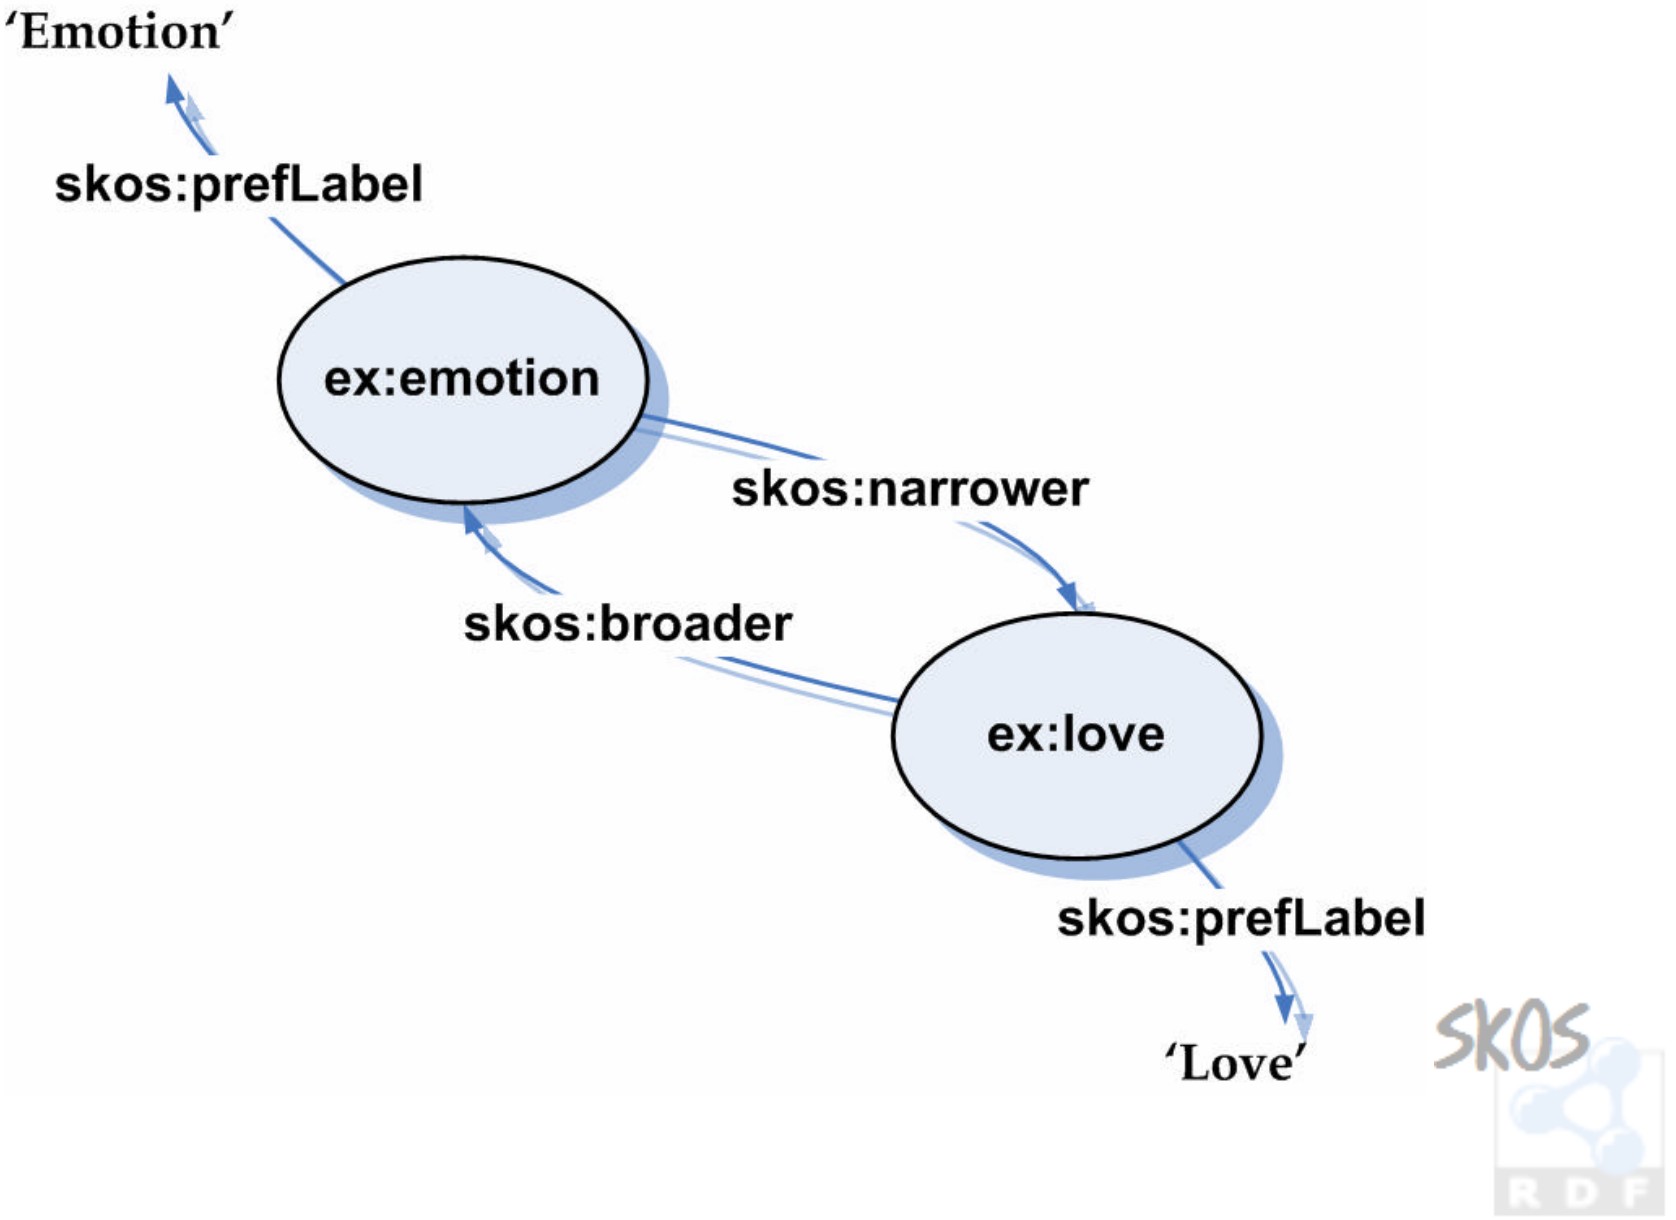
NT Love (*"NT" = Narrower Term*)

NT Awe

NT Joy

(*BT/NT only between preferred terms*)

Broader/Narrower



Thesaurus (RT)

Love

RT Beauty

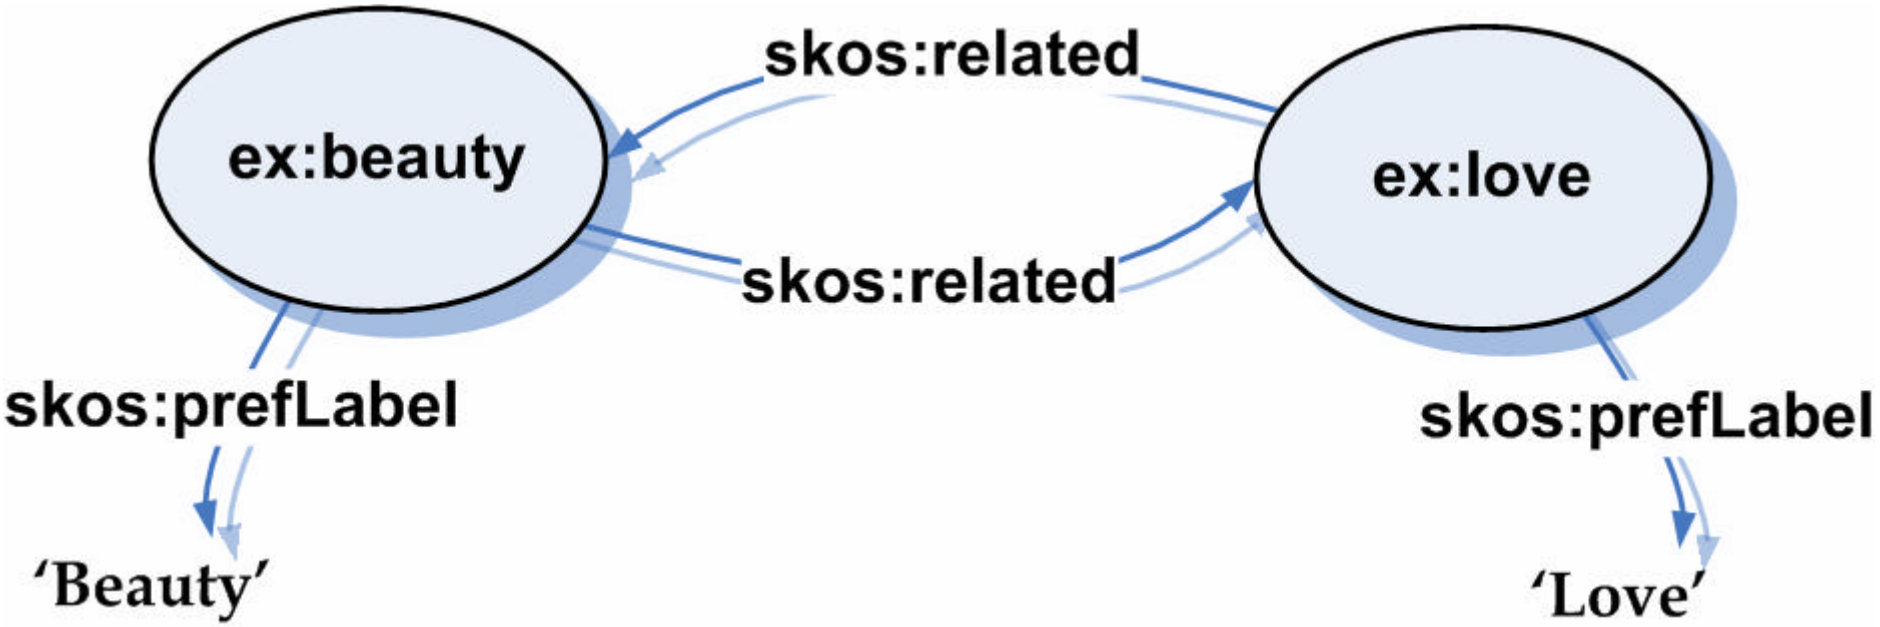
("RT" = Related Term)

Beauty

RT Love

(RT only between preferred terms)

Related



ex:beauty
skos:related
skos:related
ex:love
skos:prefLabel
skos:prefLabel
'Beauty'
'Love'

Story So Far…

- Basic Structure
  - skos:Concept
- Lexical Labelling
  - skos:prefLabel, skos:altLabel
- Documentation
  - skos:definition
- Semantic Relations
  - skos:broader, skos:narrower, skos:related

More Documentation Properties

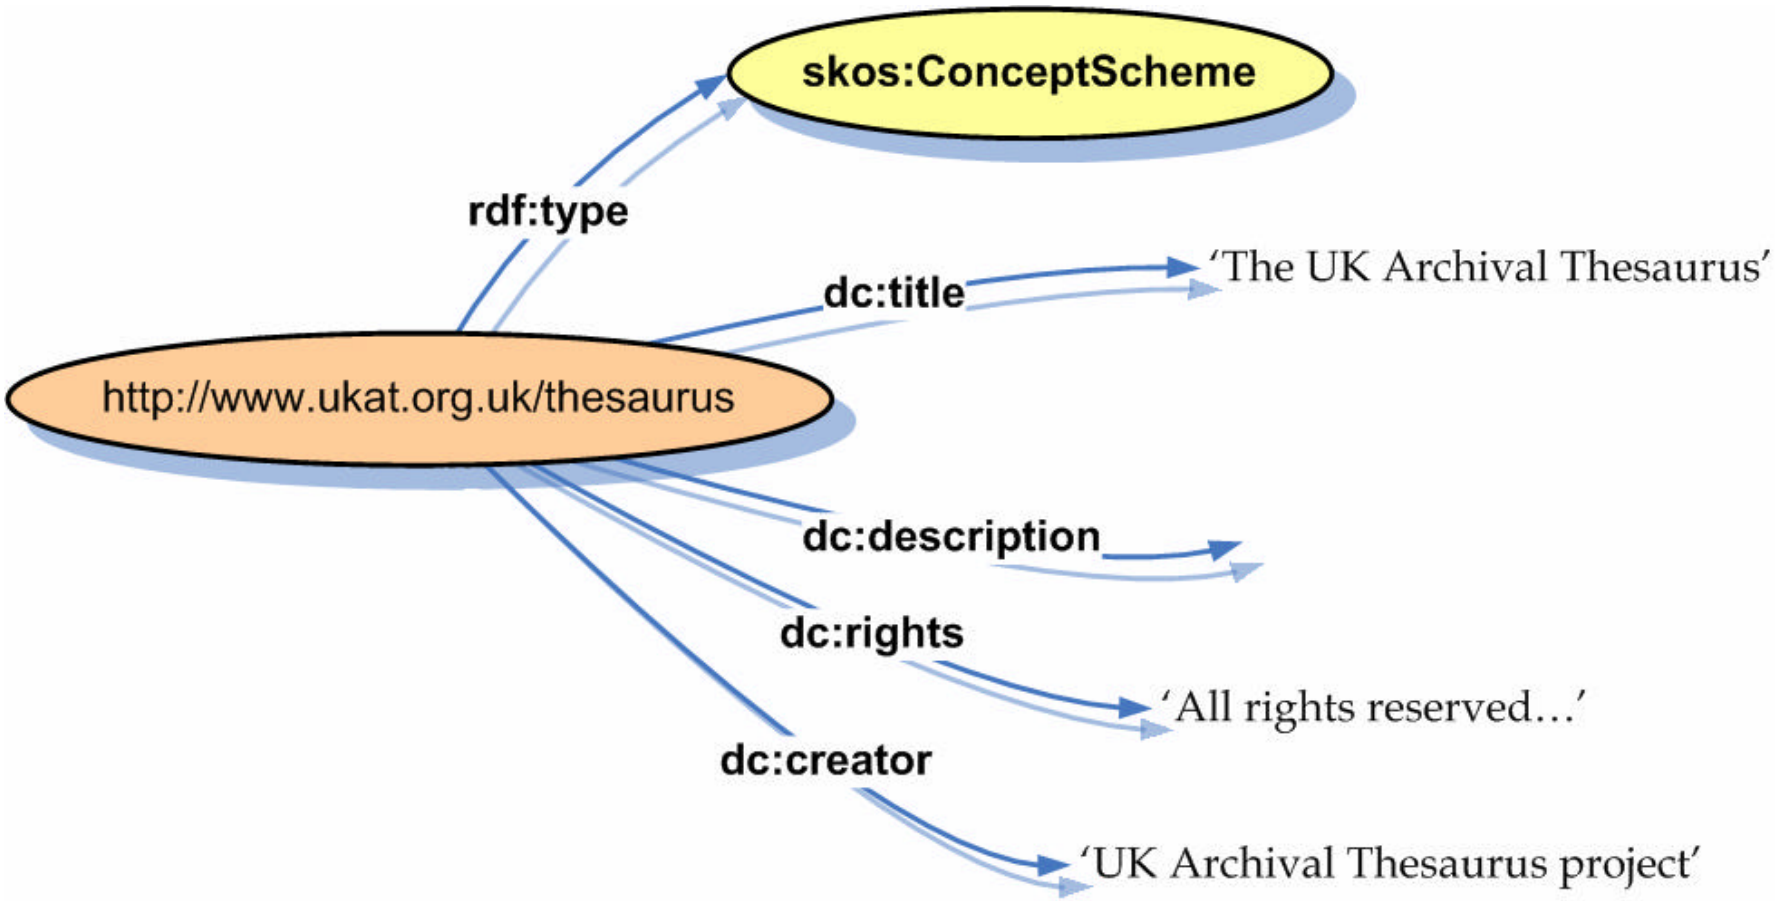
- skos:note
  - e.g. 'I'm going bananas'
- skos:definition
  - e.g. 'A long curved fruit with a yellow skin and soft, sweet white flesh inside.'
- skos:example
  - e.g. 'A bunch of bananas.'
- skos:scopeNote
  - e.g. 'Only use for the western family of bananas'
- skos:historyNote
  - e.g. 'Introduced 1986.'

Concept Schemes

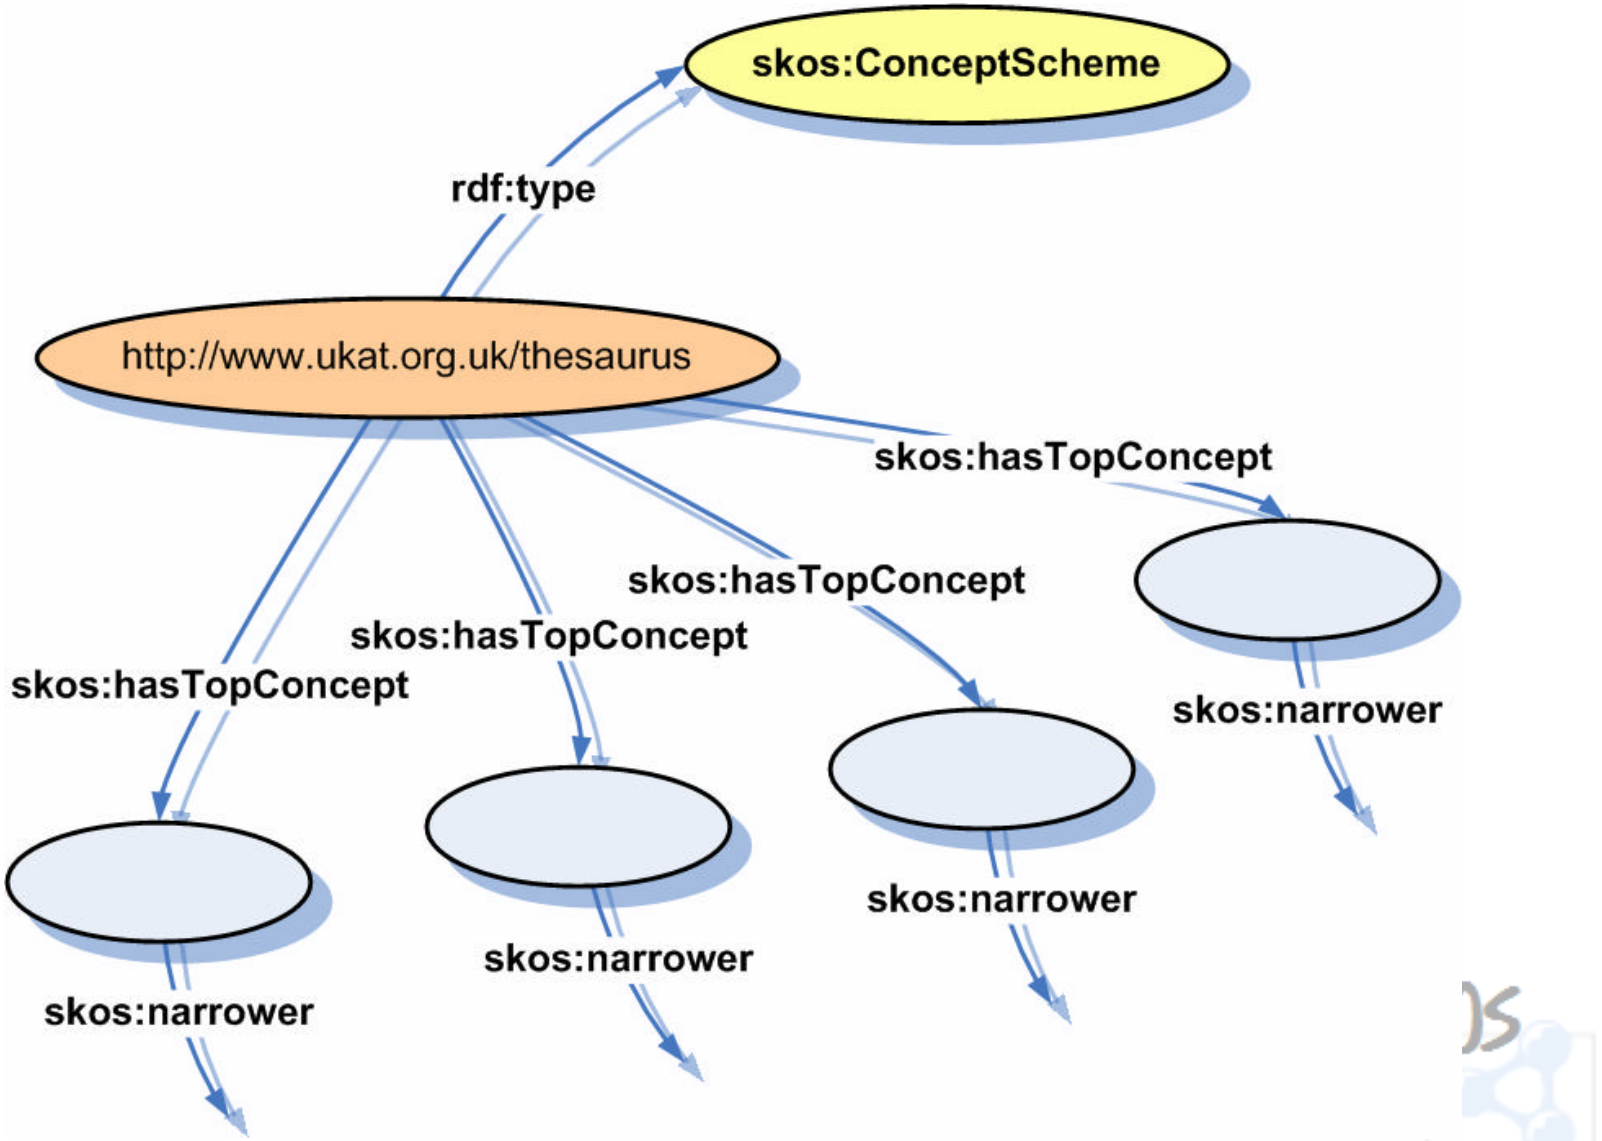
- Organise a set of concepts into a **concept scheme**

- Add metadata about the scheme
  - Title
  - Rights
  - creator

Concept Scheme



Top Concepts



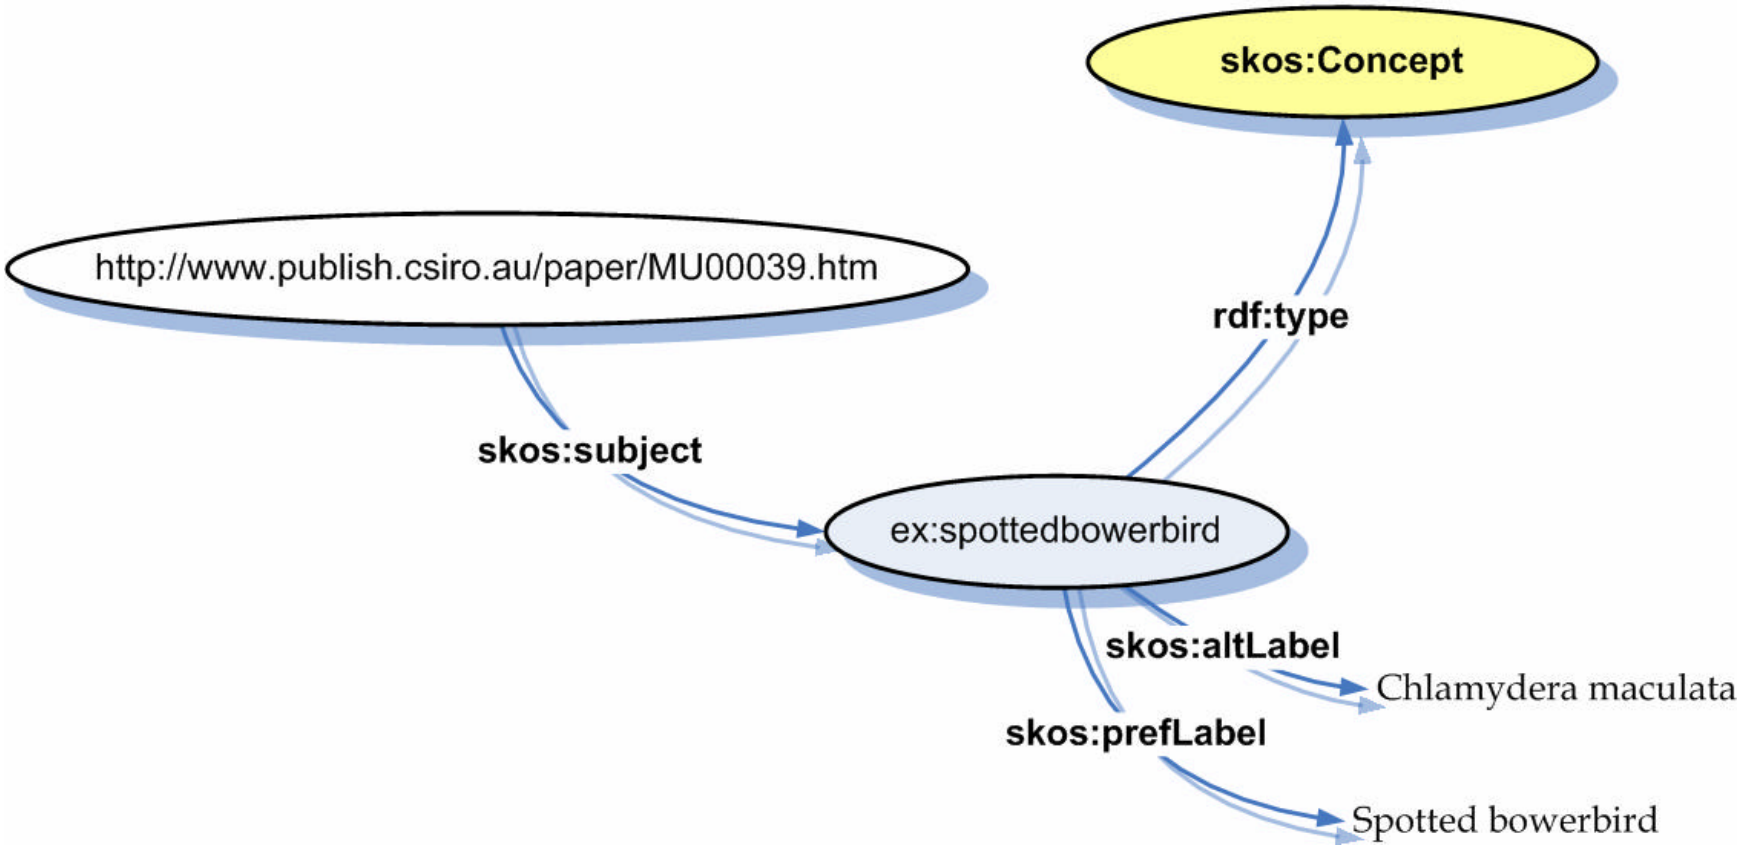
Subject Indexing

- One of the main uses of concept scheme is to index documents, pictures, …

- *skos:subject*

Spotted Bowerbird

Subject



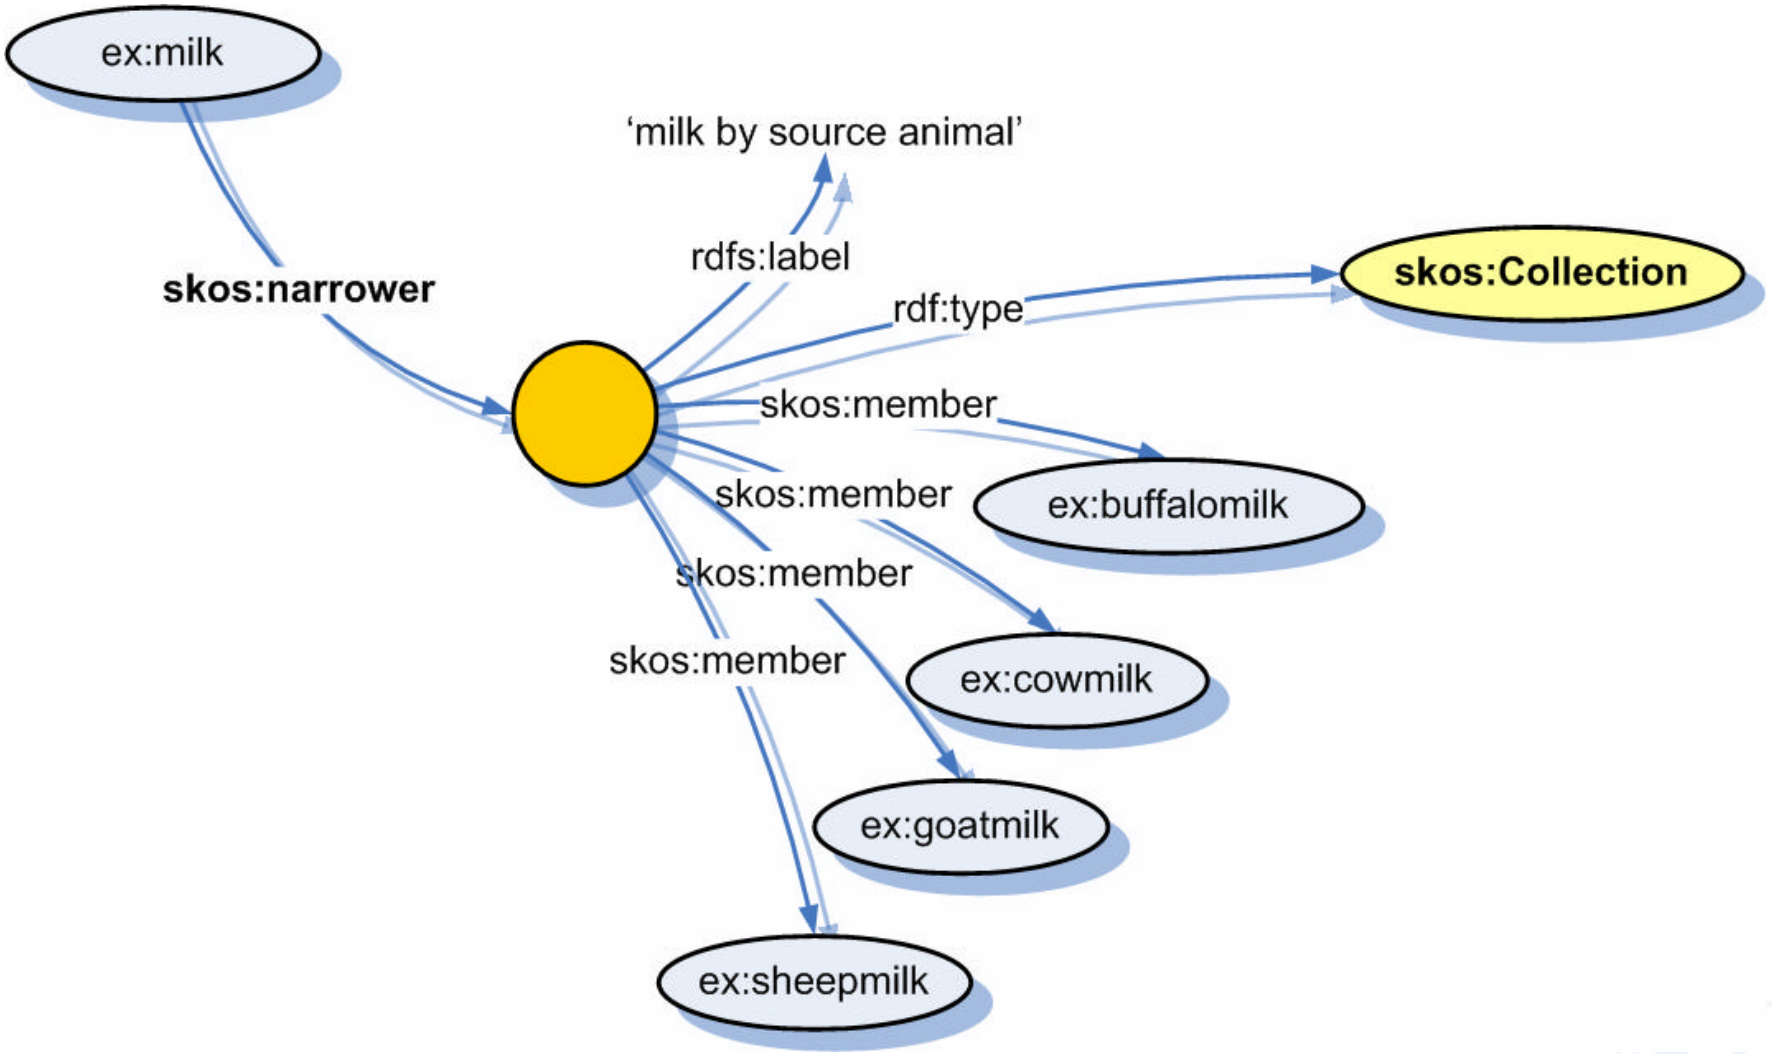
skos:Concept
http://www.publish.csiro.au/paper/MU00039.htm
rdf:type
skos:subject
ex:spottedbowerbird
skos:altLabel
Chlamydera maculata
skos:prefLabel
Spotted bowerbird

Node Labels in Hierarchy

milk
- <milk by source animal> *(node label)*
  - buffalo milk
  - cow milk
  - goat milk
  - sheep milk

(*Organize terms into “subcategories” to help users find relevant term; “guide terms”; node label itself not meant for indexing*)

Representation in SKOS



Story So Far…

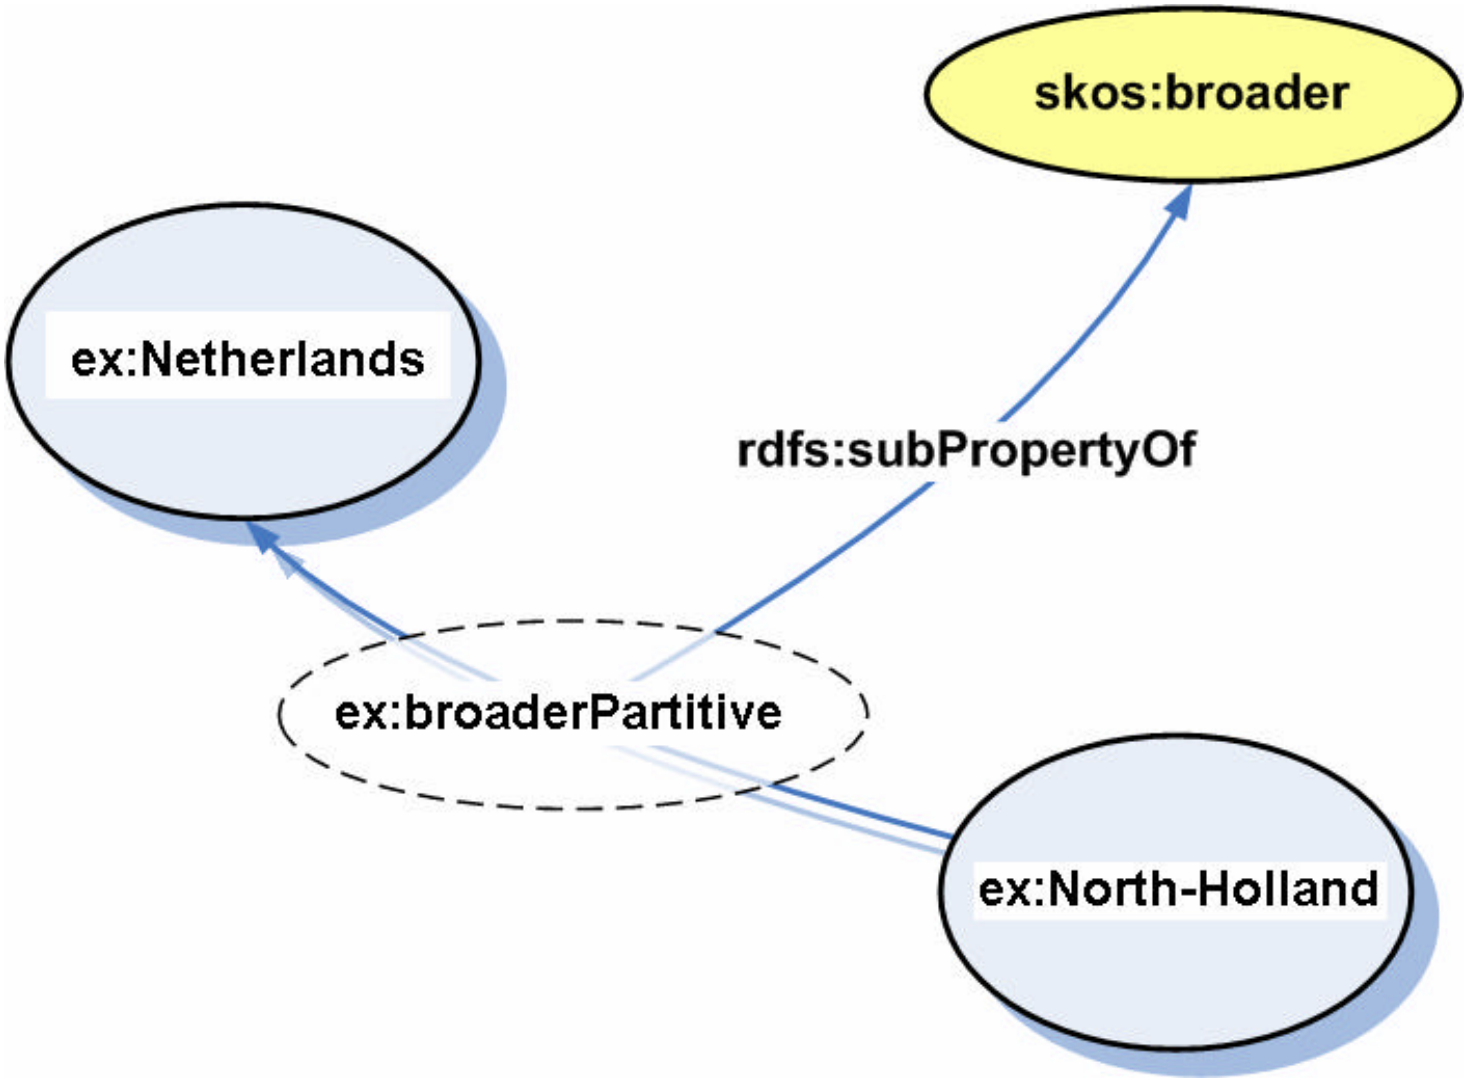
- Documentation Properties
  - skos:note, skos:definition, skos:example, skos:scopeNote, skos:historyNote
- Concept Schemes
  - skos:ConceptScheme, skos:hasTopConcept,
- Subject Indexing
  - skos:subject
- Node Labels
  - skos:Collection, skos:member
- More properties not shown here

Extensions

- SKOS Core can be **extended** by **refining** the classes and properties of the SKOS RDF Schema

- E.g. North-Holland BT Netherlands is a part-of relationship

Example



skos:broader
ex:Netherlands
rdfs:subPropertyOf
ex:broaderPartitive
ex:North-Holland
